

TANDY TRS-80 MODEL 2000 PERSONAL COMPUTER INTRODUCTION

REMARKS BY: DON WHITE

PRODUCT MANAGER

The Tandy 2000 is an ultra high performance MS-DOS based computer. It offers much more than other MS-DOS computers.

We've gained more speed thru the use of a new microprocessor... more disk storage by incorporating the latest in advanced disk drive technology... and we have included truly stunning state-of-the-art advanced graphics... and easier expansion.

Owners may run many popular MS-DOS application programs available from third parties including IBM or choose from the "best of the best" sold directly by Radio Shack. And because the Tandy 2000 is a more advanced computer, the Tandy 2000 owner can get more done in less time than owners of other microcomputers.

Tandy 2000's ergonomic options complement any corporate office and provide the smallest possible "footprint".

Our advertising states "The Tandy 2000 introduces the dawn of a new era in microcomputer technology." To explain this statement we will compare the Tandy 2000 to other MS-DOS computers including COMPAQ, the IBM personal computer and products such as the APPLE III.

The Tandy 2000 introduces a next generation microprocessor, the INTEL 80186. It offers significant performance improvement over the INTEL 8088 used in computers like the IBM PC, Texas Instruments, and the COMPAQ. The microprocessor also operates at a higher clock speed and makes the Tandy 2000 a "true" 16 bit computer. The result is a new standard in performance for MS-DOS computers. For example benchmarks provided in the January 1983 issue of BYTE magazine, when executed on a

Tandy 2000 and IBM personal computer showed the Tandy 2000 performed at over twice the speed of the IBM PC in all cases and in some cases almost 3 times the speed. These tests were run in Pascal, Fortran, BASIC, C and RMCOBOL. The November 1983 issue of Creative Computing contained a ranking of microcomputers based on execution speed of BASIC. In those tests the Tandy 2000 outperformed all computers shown and completed the test in 6 seconds as opposed to the IBM PC which took 24 seconds. The Tandy 2000 offers increased productivity by allowing popular software to run much faster.

Tandy 2000's thin-line drives feature advanced 96 TPI high capacity format. Each Tandy 2000 drive provides 720K bytes as compared to other computers such as IBM or COMPAQ that provide 320K bytes per drive. The Tandy 2000 floppy system provides 1.4 MB of disk capacity. The Tandy 2000 HD hard disk system includes a 10MB internal drive and one 720K byte diskette. The Tandy 2000 reads PC-DOS or other MS-DOS diskettes and only a disk copy is required to utilize Tandy 2000's higher capacity drives.

The stunning 640 by 400 bit mapped color graphics option displays any 8 of 16 colors. This is twice the color resolution and twice the number of colors of the IBM Personal Computer, or COMPAQ for example. The Apple III by comparison provides 280 by 192 resolution. The Tandy 2000's optional monochrome graphics provide 640 by 400 resolution. In addition graphics may be displayed on our monochrome monitor. Finally, specially designed monitors provide vivid, stable displays.

Expanding the Tandy 2000 is as simple as sliding options into "slots" in the back of the unit. This enhances servicability and saves the loss of computing time during upgrades. These options include graphics, the Digi-Mouse controller with a time/date clock, and RAM upgrades to a total of 768K. A low resolution 320 by 200 graphics option for TV or monitor also includes joystick support and a sound generator.

The Tandy 2000's 4 slots are not used by the basic system because standard features include 128K RAM, RS232, parallel printer support, monochrome monitor text support, and disk controller. In a comparably equipped IBM PC only 2 slots would be available for expansion while the Tandy 2000 would have 4 slots free.

From its keyboard to optional floor stand the Tandy 2000 offers flexibility and advanced ergonomics. The low profile 90 key detachable keyboard is easy to use and since it does not use cryptic symbols, it's easy to understand. Slide-in legends to label function keys are provided with selected applications software. The keyboard even stores under the computer when not in use.

With the keyboard in use in the lap, the "footprint" is 104 sq. inches... approximately 1/3 that of all of the computers mentioned.

The Tandy 2000 has advanced features compared to several other computers. A comparison chart is included in the press kit which you will receive at the end of these presentations.

In today's microcomputer market, software plays a very key role. We offer a wide selection of programs acclaimed by the microcomputer industry. And there are many more on the way.

The PFS family of "user friendly" programs that interact with one another are sold and supported by Radio Shack, along with Microsoft's advanced languages and productivity programs, including Multiplan and MS Word. The Ovation product is an integrated productivity tool which simultaneously displays and executes word processing, spreadsheets, graphics, and data bases. We feel that it will be the next major step forward in productivity tools. MS-Windows will be available in mid 1984 to provide a state-of-the-art windowing environment.

Other popular programs for the Tandy Model 2000 include dBASE II, or the highly acclaimed MultiMate word processor, the best selling Home Accountant and more.

We have introduced for the first time on any other computer MAI/BASIC Four's popular and proven minicomputer accounting software. This integrated software utilizes the Tandy 2000's speed and disk capacity to provide unparalleled flexibility and proven software from small business accounting.

In addition to selected "top selling" software offered in our stores, many MS-DOS products are available from other sources. A selection of products which execute on the Tandy 2000 include Bottom Line Strategist, from Ashton-Tate, IBM's Peachtree Accounting series, the full line of accounting software from Information Unlimited, along with their product EasyFiler. In a sample of approximately 100 programs, one half ran once copied to the Tandy 2000. Those which bypassed the MS-DOS conventions and directly addressed the hardware did not run. You will have an opportunity to see several of these programs running and an initial list of programs that were tested on the Tandy 2000 is in your press kit.

The 128K Tandy TRS-80 Model 2000 with two disk drives sells for \$2,750. With the optional VM-1 monitor the complete 128K RAM system retails for \$2,999. The Tandy TRS-80 Model 2000 HD with built in 10MB hard disk, 256K RAM and high capacity diskette drive retails for \$4,250. With the VM-1 monitor the system price is \$4,499.

The Tandy 2000 is an outstanding value. For example it is \$659 less than the IBM PC. The Model 2000 HD is \$1,566 less than a comparable IBM XT.

Putting it simply we believe the Tandy TRS-80 Model 2000 delivers extraordinary quality and higher performance at a lower cost than other MS-DOS computers.
