FOR IMMEDIATE RELEASE

Radio Shack Introduces RM/FORTRAN 77,

A Mainframe-Level Compiler For The TRS-80 Model 16B

Radio Shack's new RM/FORTRAN 77 program for the TRS-80 Model 16B Microcomputer is ~~the only~~ FORTRAN 77 compiler for desktop computers that has U.S. General Services Administration certification at the highest level.

As a result of certification tests conducted by GSA personnel in early February, RM/FORTRAN 77 will be listed in the federal government's Certified Compiler list as a full-level FORTRAN 77. Other compilers on this list are mainframe and minicomputer FORTRAN 77 implementations by IBM, Cray Research, Control Data, Data General, and others.

With RM/FORTRAN 77, software developers, scientists, engineers or other programmers now can use the TRS-80 Model 16B Microcomputer to write and execute mainframe-level Fortran applications. Used with the Model 16B's TRS-XENIX™ operating system, the program is a complete implementation of the most recent ANSI Fortran Standard, known as Fortran 77.

(MORE)

RM/FORTRAN incorporates popular extensions like Hollerith and hexadecimal constants, symbols of up to 31 characters and an "include" statement. Features of Fortran 77 and these extensions make it possible for the Model 16B to run many applications written for mainframes or minicomputers. The Model 16 also can be used to develop such applications.

"High optimizing" features in RM/FORTRAN, usually found only in Fortrans for much larger computers, produce object code that increases the execution speed of applications.

RM/FORTRAN 77 was developed by Ryan-McFarland Corporation of Rolling Hills Estates, Calif., a company with more than 20 years experience developing Fortran languages for mainframe and minicomputer manufacturers.

RM/FORTRAN 77 (26-6451) for the Model 16B is available for \$699 through the more than 1,000 Radio Shack Computer Centers nationwide. Radio Shack is a division of Tandy Corporation.
