TK!Solver, Software Arts' Sophisticated Equation Solver

Now Available for the TRS-80 Model 4 Computer

Now professionals in engineering, finance, and education, students and others who use equations for problem solving can save time and increase accuracy with the help of the TK!Solver™ program. TK!Solver, a mathematical analysis "Tool Kit" from Software Arts, has been added to the line of software for Radio Shack's TRS-80® Model 4 Computer.

TK!Solver is both sophisticated in capability and simple to use. The user need not be a computer expert to take full advantage of this program. Using either personally structured or standard textbook formulas, the user states the problem (i.e., enters the equation), inputs the known values and with a single keystroke, the problem is solved.

Part of TK!Solver's sophistication lies in its ability to interpret an algebraic equation as an equation, not an assignment statement. For example, in the equation $a+b=c*d$ if "d" were the variable of unknown value, TK!Solver would move all the known variables to the right of the equals sign, reinterpret the equation as $d=(a+b)/c$, and then solve for the value of "d."

(MORE)

Another of TK!Solver's advanced features is its ability to solve problems which require repeated (iterative) calculations. When an equation cannot be solved using the direct method, TK!Solver uses successive approximations to find the answer. The user initiates the process with a "best guess" value for the unknown variable or variables and the procedure then repeats a set of operations with each repetition more closely approximating the answer. The process continues until it reaches a solution which lies within the error range limits specified by the user or until the number of iterations set by the user has been executed.

TK!Solver replaces paper with screen displays called Sheets. Equations, properties or characteristics of each variable, including values and units, conversion definitions for units of measure, and a variety of other factors are entered on the Sheets. With TK!Solver lists of values can be created and associated with variables in a model, conversion definitions can be changed, and the results of analysis can be placed in tables and/or graphs. On-line "help" and error checking are also provided.

With a total of thirty-four mathematical functions built into TK!Solver, ranging from trig, log and square root to inverse hyperbolic tangent and log base 10 functions, this program is an important mathematical tool for professionals involved in analysis, design, and planning. A Model 4 Computer equipped with 128K of memory is required for this program. TK!Solver for the Model 4 Computer (26-1630) retails for \$299.95 and at Radio Shack Computer Centers, Radio Shack Stores and participating Dealers.
