CHILDREN AND COLOR COMPUTERS:

THE SCHOOL/HOME CONNECTION

Children are curious, and want to learn and create. For the past five years, they've been doing just that in hundreds of school districts across the country with the Tandy Color Computer™. Whether kids get their introduction to the Color Computer at school or at home, the wide range of creative educational software makes learning an enjoyable experience.

More than 500 educational software titles are available for the Color Computer, which is one of the reasons Color Computers are found in so many elementary schools. Schools also selected the computers for their low cost and easy use, as well as the nationwide local support offered by Radio Shack®. Almost half a million school teachers have been trained in free educator's workshops offered by the company.

Kids like the bright colors and images created by the 500+ software packages that run on the Color Computer. Peripherals such as The Electronic Book used with the Color Computer allow even pre-schoolers to benefit from state-of-the-art educational software.

-MORE-

Parents and educators agree that the wide availability of software and the computer's or system's easy expandability are key reasons for choosing a Tandy Color Computer. "A very low-cost initial set-up can expand to meet changing interests and needs, by adding peripherals and upgrades," Gattis points out. Shared learning networks link student work-stations to their teacher's host computer in many classrooms, and a full line of peripherals and upgrades are available for home or school use.

"Parents who buy a computer often see it primarily as an educational tool. For that reason, we feel it's important that the computer selected be one which allows the child to meet new challenges as his knowledge and interests grow and change. The learning games that will keep a six year-old entranced would bore an older child, so it's important that there be a full range of options available," Gattis points out. Color Computer software ranges from simple counting games to complex assembly language programming tutors, and the scope of available software continues to grow.

"A computer can be a very valuable link between the lessons the students learn in school and their after-school learning. Sometimes we forget that children learn all the time, and having a computer in the home is a good way to encourage them, especially if parents get involved in selecting software and working with the child," Gattis said.
