

TANDY PRODUCT ANNOUNCEMENT, AUGUST 3, 1987

Dr. Scott E. Cutler
Senior Director, Software
Tandy Computer Applications

For the past three years, Tandy has included a collection of software with most of its computers or operating systems which makes the computer useful to the customer as soon as it is sold. These software products are the DeskMate family. Today we are very excited to talk about the two newest members of the DeskMate family; Personal DeskMate 2 and Professional DeskMate. Both of these programs use state-of-the-art, bit-mapped graphics and pointing devices popularized by the Apple Macintosh and Microsoft Windows.

Personal DeskMate 2 (PDM 2) is the follow-on product to Personal DeskMate which was introduced a year ago for the Tandy 1000 EX personal computer.

Personal DeskMate 2 is a state-of-the-art program providing a complete set of basic applications. These applications include:

- o a Text editor which provides basic letter creation and editing;
- o an index card Filer, easy-to-use data base structured in the form of familiar, again easy-to-use index cards;
- o a Spreadsheet, one of the most often used applications, shipped with annotated examples of a checkbook ledger and a home budget, and;
- o a Calendar which provides yearly, monthly, weekly and

(more)

daily display modes plus all major holidays well into the 21st century.

Personal DeskMate 2 also contains a telecommunications application for communicating with outside data bases such as CompuServe. Two additional home-oriented applications are included which I will describe a little later.

It uses Windows-like dialog boxes and pull down menus. The keyboard syntax is quite similar to that of Microsoft's Windows program and is thus an excellent learning tool for OS/2. The main menu acts as a graphical DOS executive, allowing the user to avoid the cryptic nature of many DOS commands. User definable programs such as Lotus 1-2-3 and dBase can be executed from the main menu.

To increase productivity, a number of accessories are provided which can be called from within any PDM 2 application. Included in these are:

- o a Note Pad capable of storing today's "to do" list;
- o a Calculator whose output can be cut and pasted into other applications, and;
- o a Phone Directory with over 100 names and numbers. A built-in auto-dialer function transparently interfaces with most of today's most popular modems. It allows the user to call a name on the list by just pointing to the name and typing one key.

Two important goals in the development of Personal DeskMate were to provide an easy-to-use interface for the first-time user

(more)

and to demonstrate the features of our computers. Personal DeskMate 2 follows in that tradition. The 3.5-inch disk drive allows the nearly 700 thousand bytes of Personal DeskMate 2's code and data to fit on a single diskette. On the Tandy 1000 HX personal computer, half of the million bit Read Only Memory (ROM) is dedicated to the internal core of PDM 2. If the user desires, the 1000 HX can be configured to automatically come up in the DeskMate main menu in about the time it takes for the monitor to warm up (for those who have used MS-DOS, that's fast). PDM 2 has significant speed and keyboard useability improvements over last year's original PDM program. It is fast, easy to learn and easy to use.

A Music application has been added to PDM 2. It plays songs with thousands of notes in up to three simultaneous voices. It takes advantage of the enhanced sound circuitry that the Tandy 1000 line has over conventional PC-compatible computers. A number of songs, including a Christmas medley, are shipped with the product.

Likewise, to take advantage of the Tandy 1000's built-in enhanced graphics modes, we have added a sixteen color Paint application. The rest of PDM 2 takes advantage of the Tandy 1000's high resolution, 640 X 200, 4-color display mode.

As you can see, Personal DeskMate 2 is a state-of-the-art program. It not only has pizzazz, but true value for the Tandy 1000 customer.

(more)

The second member of the DeskMate family that we are talking about today is geared for the business, professional and office environments. This product is called Professional DeskMate. We are very excited about this product.

Professional DeskMate shares much with Personal DeskMate 2. It has the same user interface, the same look and feel and many of the same applications.

Music and Paint have been replaced by Mail and Draw. Whereas Personal DeskMate takes advantage of Tandy 1000 enhancements in the video and sound areas, Professional DeskMate operates over our complete line of MS-DOS computers from the laptop to the Tandy 4000 personal computer, and operates with EGA and other video adapters in addition to the Tandy 1000 graphics modes. A task switching capability is included which allows the user to quickly transfer between Professional DeskMate and another application.

What makes Professional DeskMate a truly exciting and unique program is in its workgroup-related functions. Through a facility we call DeskLink, users can transfer files between machines and perform a number of useful workgroup functions. Transferring files between machines is as simple as pointing to a file through the DeskLink accessory and pulling down the copy command. Using the DeskLink print options, files can be printed on a remote printer.

(more)

It has an electronic Mail application. Messages, along with attachments, can be sent between users in the workgroup. Messages can be stored and recalled at a later date. This one application often justifies the installation of connected personal computers. Once a portion of a company starts using electronic mail, the usage spreads very rapidly.

The Phone Directory is enhanced to not only include your own list of phone numbers, but to share a central phone list.

The Calendar has been greatly enhanced. Among its workgroup features is the ability to manage a shared calendar, including the automatic scheduling of meetings among a number of people.

If a timing conflict arises, the schedules of all parties are displayed so that an appropriate time can be selected or previous meeting overridden. We all know how useful this feature can be.

Professional DeskMate provides workgroup connectivity without the difficulty and confusion often associated with networks. Installation is as simple as typing DESKLINK and answering a few questions. All DeskLink functions are written to the NetBios standard which means DeskLink functions in a wide variety of hardware environments. Three such environments transparently supported by Professional DeskMate are a very low cost, two-user RS-232 serial connection, our 3COM network product and our new, low cost twisted pair network called TandyLink.

(more)

The RS-232 option lets two users operate in a workgroup environment at minimal cost. Since it can use the built-in serial port included in most of our computers, the only hardware required is a simple cable. This feature can even be used to network our new laptop to an office-based computer.

TandyLink is our low cost network board. It will retail for under \$150 per node. It is electrically compatible with Apple's AppleTalk network, utilizing the same wire. However, the TandyLink board includes the network connection, eliminating the need for Apple's \$75 connector kit. It runs at a bit rate of 768 Kbaud, three and one-third times the AppleTalk standard of 230.4 Kbaud. Using third-party products, such as Centram's TOPs for the PC, the TandyLink board can communicate with Apple Macintosh computers as well as PC-compatibles at the standard AppleTalk rate.

Tandy can provide a very low cost, highly productive workgroup environment which does not require a computer wizard to install or maintain. Professional DeskMate is a powerful, easy-to-use product for the stand-alone and workgroup environments. As you might guess, we are very excited about Professional DeskMate and workgroup computing.
