TandyLinkTM and Professional DeskMateTM Put Your PCs on Speaking Terms

Now there's a
simple, affordable
way to achieve
PC communication.

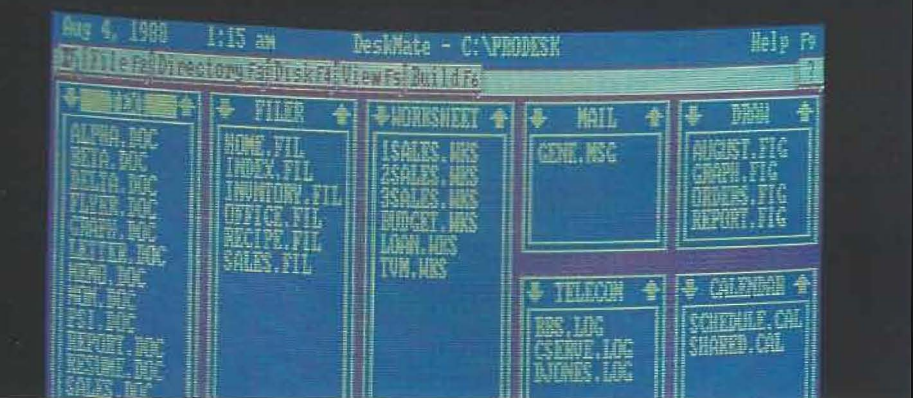

Productivity is as important for an entire office as it is for an individual. Putting a PC on everyone's desk is a great way to improve personal productivity, but boosting office productivity requires the creation of an efficient workgroup.

To give you the tools for both personal and office-wide productivity, Radio Shack® developed Professional DeskMate integrated software and the TandyLink workgroup—partners in productivity.

Professional DeskMate gives individual users the tools they need for personal productivity and, when interconnected through a TandyLink workgroup, the ability to share information throughout the office and then print that information using a shared printer.

The combination of Professional DeskMate and TandyLink is unique in its ability to perform workgroup based applications in a manner that is remarkably easy and surprisingly affordable. A TandyLink workgroup requires no dedicated file server, is user-installable and operates on the entire line of Tandy® and other IBM® compatible computers.

TandyLink exemplifies Tandy's commitment to workgroup solutions with a building block approach. Whether you are connecting two workstations or an entire office, you never have to buy more connectivity hardware than you need.

Professional DeskMate and TandyLink: Partners in Productivity.

Professional DeskMate Is the Answer for Personal and Workgroup Productivity

For personal productivity, Professional DeskMate includes Text for creating and updating documents, Worksheet for financial spreadsheets, Filer for data bases, Calendar for appointment scheduling, Telecom for access to on-line data services and a Draw program for business graphics. But, unlike other DeskMate packages, Professional DeskMate has special workgroup functions designed to increase office productivity.

Professional DeskMate's state-of-the-art graphical interface simplifies learning because all applications are accessed through the DeskMate interface. Operations are streamlined through the use of dialogue boxes and pull-down menus. In keeping with technological trends, all functions of Professional DeskMate are accessible via the keyboard or through the use of a mouse.

Transmit Files

From anywhere in any Professional DeskMate program you can transmit files to or from directories on other computers in the workgroup which have been made available to the workgroup. A shared directory allows users to see files existing in other machines which have been made available to the workgroup. File manipulation such as renaming and copying can also be performed on remote files.

Electronic Mail

Use of electronic mail in a workgroup environment allows you to send messages between computer users within the workgroup. Messages can be created at any workstation and sent to any user in the workgroup.

Shared Calendar

Professional DeskMate's calendar function operates in daily, weekly, monthly and yearly modes allowing for long-term planning and scheduling without conflicts. Individual calendar functions keep each user apprised of appointments. All appointments become a part of a shared calendar that alerts you if you accidentally create a scheduling conflict for any member of the workgroup. The shared calendar allows you to schedule a meeting for up to 24 people. If a scheduling conflict occurs, calendars can be compared to identify conflicts and find an available meeting time.

Shared Phone List

A personal phone list allows each user to maintain a personal file of often-used phone numbers. All workstations can have access to a large shared phone file. From anywhere within Professional DeskMate, you can call up the phone accessory and use the shared phone list.

Shared Use of Remote Printers

By executing the print command any user in the workgroup can print files on a shared printer. Using a shared printer is

much more cost-effective than equipping each workstation with a printer.

How It Works

Professional DeskMate utilizes the industry standard NET BIOS protocols and can be run on any workgroup or connectivity hardware that understands NET BIOS including TandyLink, 3Com® and IBM networks.

TandyLink—Connectivity That Meets Your Present and Future Needs

Two configuration options keep workgroup solutions affordable because you never have to invest in more hardware than you need. For the most economical link between two computers, such as between a manager and a secretary or between two associates, a simple RS-232 connection between serial ports allows for the full range of workgroup functions. As your needs grow, or for larger workgroups in the 6-10 station range, the addition of an inexpensive TandyLink card to each computer creates a surprisingly low-cost workgroup for an office or department. For even larger workgroups, Professional DeskMate runs transparently on the extremely powerful 3Com network.

No Dedicated File Server

Any computer on the workgroup can act as a file server and still have enough system memory to act as a workstation. Professional DeskMate/TandyLink requires less than 22K to be connected to the system and only about 100K to share everything. The compact design of the software allows everyone to have their own computer while sharing portions of their information.

TandyLink

The TandyLink card fits inside all Tandy 1000, 3000 and 4000-class computers. On Tandy 3000s, 4000s and the Tandy 1000 SX and TX, the board fits into an 8-bit slot. Through the use of PLUS-style TandyLink add-on boards, TandyLink can be used with the Tandy 1000 EX and HX. Computers are linked by a cable to form a multistation workgroup. TandyLink includes drivers that allow it to operate under NET BIOS protocols allowing you to run all of the Professional DeskMate applications over the TandyLink board.

Runs on All Tandy 1000, 3000 and 4000 Computers

No matter how your present computers are configured or what computers you already own, Professional DeskMate and TandyLink will operate without modification to the hardware or the software. Present boards, including video, will continue to run just as they always have. What's more, you can use any combination of Tandy computers in your workgroup so that each workstation can be outfitted with the computer that best suits the user's needs.
