**TANDY'S MODULAR COMPUTER DESIGN
PROVIDES MAXIMUM FLEXIBILITY IN MANUFACTURING**

FORT WORTH, Texas (September 28, 1989) -- Tandy Corporation's newest '386™ processor based business computers feature a modular architecture that minimizes design time and provides maximum flexibility in manufacturing, explained Dr. John D. Patterson, vice president of Tandy Computers.

"This month, Tandy's computer manufacturing plants produced approximately 70 different desktop configurations, with about 35 configurations produced in our new Tandy Electronics Personal Computer Division facility," Patterson said. "These serve our broad spectrum of distribution consisting of Radio Shack, McDuff Electronics, GRiD Systems, InterTAN, Digital Equipment Corporation, Panasonic Industrial Company Office Automation Group and others."

The modular architecture features a separate processor board which contains the CPU, cache controller and coprocessor socket. A computer, like the new Tandy® 4025 LX, can be easily configured at the manufacturing plant by installing a 25MHz CPU board on a standard chassis and using a few different components on the main logic board.

"This modular concept enables Tandy to minimize engineering development time in the future as microprocessors continue to evolve," Patterson added.
